Assignment 9.4: Responsive Landing Page (Build)

Goal: build the initial desktop version of a landing page from a reference design, then push it to GitHub.

1. Analyze the reference design

- **Colors:** primary, text, muted text, background, surface. Use a color picker to get hex codes.
- **Typography:** font family, heading and body sizes, weights.
- **Images:** list each image, its size and where it appears.
- **Layout:** navbar, hero (columns), feature cards (how many per row), CTA, footer. Note spacing between sections.

Put the values in CSS variables so they are easy to change:

```
:root { --primary: #2563eb; --text: #1f2933; --surface: #f5f7fa;
        --font: system-ui, sans-serif; --gap: 2rem; }
```

2. Project structure

```
project/
  index.html
  style.css
  images/
```

3. Semantic HTML

```
<header>  <nav> ... </nav>  </header>
<main>
  <section class="hero"> ... </section>
  <section id="features"> <article class="card"> ... </section>
  <section id="contact" class="cta"> ... </section>
</main>
<footer> ... </footer>
```

Include `<meta name="viewport" content="width=device-width, initial-scale=1">` in the head, and alt text on every image.

4. Desktop layout: Grid and Flexbox

```
.header-inner { display: flex; justify-content: space-between; align-items: center; }
.nav ul       { display: flex; gap: 2rem; }
.hero-inner   { display: grid; grid-template-columns: 1fr 1fr; gap: 4rem; align-items: center; }
.hero-actions { display: flex; gap: 1rem; }
.cards        { display: grid; grid-template-columns: repeat(3, 1fr); gap: 2rem; }
.card         { display: flex; flex-direction: column; gap: .5rem; }
```

Use Grid for multi-column layouts (hero, cards) and Flexbox for alignment (navbar, buttons, card contents).

5. Base styling and spacing

- Add a reset: `box-sizing: border-box`, margin 0 on body.
- Center content with a `.container { max-width: 1140px; margin: 0 auto; }`.
- Use consistent vertical padding for sections (e.g. 4 to 5rem).
- Style buttons with hover states; keep images at max-width: 100% and height: auto.

6. Push to GitHub

Create an empty repository on github.com first (no README), then run in the project folder:

```
git init
git add .
git commit -m "Initial desktop version of landing page"
git branch -M main
```

```
git remote add origin https://github.com/<your-username>/<repo-name>.git
git push -u origin main
```

Optional: enable GitHub Pages (Settings, then Pages, then deploy from main) to get a live link.

Submission checklist

- index.html and style.css
- images folder
- Desktop screenshot (optional but helpful)
- GitHub repository link
